

06 December 2017

## Significant Exploration Results Continue at Bald Hill

**Tawana Resources NL** (ASX:TAW) (“**Tawana**” or the “**Company**”) and **Alliance Mineral Assets Limited** (SGX: AMA) (**AMAL**) are pleased to announce that extensional step-out drilling and mapping at the Bald Hill Project, in the Eastern Goldfields region of Western Australia has significantly increased the footprint of the known lithium and tantalum pegmatite swarm. The Bald Hill Project is a joint project between Tawana and AMAL.

### Highlights - Drilling

- Eastern high-grade extension. Significant results include:
  - **31m at 1.46% Li<sub>2</sub>O** from 143m, including **18m at 1.88% Li<sub>2</sub>O** in LRC0702;
  - **35m at 1.74% Li<sub>2</sub>O** from 146m including **15m at 2.11% Li<sub>2</sub>O** in LRC0703.

This mineralised zone remains open to the east and south.

- Boreline South Eastern Extension. Significant results include:
  - **7m at 1.38% Li<sub>2</sub>O** from 113m in LRC0665;
  - **6m at 1.45% Li<sub>2</sub>O** from 150m LRC0675;
  - **9m at 0.93% Li<sub>2</sub>O** from 41m and **10m at 1.11% Li<sub>2</sub>O** from 117m in LRC0677.

This mineralised zone remains open to the south.

- Initial lithium drilling at Fenceline prospect. Significant results include:
  - **7m at 1.35% Li<sub>2</sub>O** from 29m in LRC0672;
  - **7m at 0.54% Li<sub>2</sub>O** from 65m and **5m at 0.80% Li<sub>2</sub>O** from 82m in LRC0674.
- Deeper pegmatite below starter pit. Significant results include:
  - **7.78m at 2.46% Li<sub>2</sub>O** from 234m including **2.78m at 4.27% Li<sub>2</sub>O** in LDD0001;
  - **6m at 2.03% Li<sub>2</sub>O** from 135m in LDD0003.

### Highlights – Mapping, Water Exploration Drilling

- Several outcropping lithium and tantalum pegmatites discovered SW of the Fenceline prospect.
- A single water exploration drill hole drilled on R15/001, 700m west of the starter pit, intercepted 3 spodumene pegmatites.

Tawana Resources Managing Director Mark Calderwood stated: *“With a number of significant resource targets, the Joint Venture is considering increasing the pace of drilling in the new year. One rig will continue with infill drilling whilst one to two rigs will work on step out drilling and testing newly discovered lithium pegmatites.*

*We remain on track to joining the lithium producer ranks in 1Q18.”*

## Recent Drilling

A further 87 Reverse Circulation drill holes totalling 12,222m and 7 core holes totalling 750m were completed between 2 August and 4 October 2017. Of these 94 holes drilled, only 20 were completed in time to be included in the October Resource Estimate (Refer ASX Release 11 October 2017). Recent intercepts are summarised in Tables 3, 4 and 5 in Appendix A.

Areas of focus for recent drilling were:

- Eastern high-grade extension, six holes completed. Significant results include:
  - 17m at 0.93% Li<sub>2</sub>O from 119m in LRC0685;
  - 19m at 0.98% Li<sub>2</sub>O from 156m, including 9m at 1.26% Li<sub>2</sub>O in LRC0701;
  - 31m at 1.46% Li<sub>2</sub>O from 143m, including 18m at 1.88% Li<sub>2</sub>O in LRC0702;
  - 35m at 1.74% Li<sub>2</sub>O from 146m including 15m at 2.11% Li<sub>2</sub>O in LRC0703.

This mineralised zone remains open to the east and south.

- Boreline South Eastern Extension, eight holes completed. Significant results include:
  - 7m at 1.38% Li<sub>2</sub>O from 113m in LRC0665;
  - 6m at 1.45% Li<sub>2</sub>O from 150m LRC0675;
  - 9m at 0.93% Li<sub>2</sub>O from 41m and 10m at 1.11% Li<sub>2</sub>O from 117m in LRC0677.

This mineralised zone remains open to the south.

- Initial lithium drilling at Fenceline prospect, four holes completed. Significant results include:
  - 7m at 1.35% Li<sub>2</sub>O from 29m in LRC0672;
  - 7m at 0.54% Li<sub>2</sub>O from 65m and 5m at 0.80%Li<sub>2</sub>O from 82m in LRC0674.
- Deeper pegmatite below starter pit, two prior holes partly assayed. Significant new results include:
  - 7.78m at 2.46% Li<sub>2</sub>O from 234m including 2.78m at 4.27% Li<sub>2</sub>O in LDD0001;
  - 6m at 2.03% Li<sub>2</sub>O from 135m in LDD0003.
- Notable intercepts from Resource Infill drilling not included in the October Resource Estimate include:
  - 23m at 1.31% Li<sub>2</sub>O from 115m in LRC0494;
  - 11m at 2.01% Li<sub>2</sub>O from 132m followed by 10m at 1.00% Li<sub>2</sub>O from 146m in LRC0495;
  - 28m at 1.48% Li<sub>2</sub>O from 110m including 12m at 2.04% Li<sub>2</sub>O from 124m in LRC0499;
  - 22m at 1.03% Li<sub>2</sub>O from 83m in LRC0500;
  - 29m at 0.90% Li<sub>2</sub>O from 105m followed by 11m at 1.35% Li<sub>2</sub>O from 133m in LRC0636;
  - 14m at 1.59% Li<sub>2</sub>O from 133m including 7m at 2.03% Li<sub>2</sub>O from 138m in LRC0637;
  - 31m at 1.50% Li<sub>2</sub>O from 134m in LRC0638;
  - 11m at 1.72% Li<sub>2</sub>O from 40m and 12m at 1.17% Li<sub>2</sub>O from 80m in LRC0640;
  - 14m at 1.56% Li<sub>2</sub>O and 296ppm Ta<sub>2</sub>O<sub>5</sub> from 63m including 6m at 2.93% Li<sub>2</sub>O in LRC0695.

Exploration has recently focused on initial grade control, water bore installation and water exploration drilling. A recently completed water exploration hole (LRC0706) drilled 700m west of the current proposed starter pit (refer Figure 2) intercepted four pegmatites at shallow depths, three of which contained visible spodumene; 23-25m - moderate spodumene; 27-31m - high spodumene; and 43-49m - moderate spodumene.

## Mapping and Sampling

Outcrop mapping and sampling has been undertaken on R15/01. Several outcropping spodumene and tantalum pegmatites have been located highlighting the potential, at depth, for the more important sub-horizontal pegmatites. A total of 75 rock chip and channel samples were collected over a wide area of which 54 contained visual spodumene or anomalous lithium, tantalum or tin. Refer Table 1.

Notes : OC = outcrop, SC = sub-outcrop, FT = float,

CHIP = chip sample, CHNL = channel sample, GRAB = grab sample.

Samples BHRK0004, 0005 and 0072 contained visible weathered spodumene however were not analytically anomalous.

### **Competent Persons Statement**

The information in this news release that relates to Exploration Results is based on and fairly represents information and supporting documentation compiled by Mr Mark Calderwood and Mr Gareth Reynolds, both employees of Tawana Resources NL ("Tawana"). Mr Calderwood is a member of The Australasian Institute of Mining and Metallurgy and Mr Reynolds is a member of the Australian Institute of Geoscientists. Mr Calderwood and Mr Reynolds have sufficient experience relevant to the style of mineralisation under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Calderwood and Mr Reynolds consent to the inclusion in this report of the matters based on their information in the form and context in which it appears. Mr Calderwood and Mr Reynolds meet the requirements to act as a Qualified Person (as defined in the SGX Catalist rules).

Mr Calderwood is a significant shareholder in Tawana. Mr Calderwood and Tawana do not consider these to constitute a potential conflict of interest to his role as Competent Person. Mr Calderwood is not aware of any other relationship with Tawana which could constitute a potential for a conflict of interest.

Mr Reynolds is an employee of Tawana. Mr Reynolds is not aware of any other relationship with Tawana which could constitute a potential for a conflict of interest.

### **Forward Looking Statement**

This report may contain certain forward looking statements and projections regarding estimated, resources and reserves; planned production and operating costs profiles; planned capital requirements; and planned strategies and corporate objectives. Such forward looking statements/projections are estimates for discussion purposes only and should not be relied upon as representation or warranty, express or implied, of Tawana Resources NL and/or Alliance Mineral Assets Limited. They are not guarantees of future performance and involve known and unknown risks, uncertainties and other factors many of which are beyond the control of Tawana Resources NL and/or Alliance Mineral Assets Limited. The forward looking statements/projections are inherently uncertain and may therefore differ materially from results ultimately achieved.

Tawana Resources NL and/or Alliance Mineral Assets Limited does not make any representations and provides no warranties concerning the accuracy of the projections, and disclaims any obligation to update or revise any forward looking statements/projects based on new information, future events or otherwise except to the extent required by applicable laws. While the information contained in this report has been prepared in good faith, neither Tawana Resources NL and/or Alliance Mineral Assets Limited or any of their directors, officers, agents, employees or advisors give any representation or warranty, express or implied, as to the fairness, accuracy, completeness or correctness of the information, opinions and conclusions contained in this presentation. Accordingly, to the maximum extent permitted by law, none of Tawana Resources NL and/or Alliance Mineral Assets Limited, their directors, employees or agents, advisers, nor any other person accepts any liability whether direct or indirect, express or limited, contractual, tortious, statutory or otherwise, in respect of, the accuracy or completeness of the information or for any of the opinions contained in this announcement or for any errors, omissions or misstatements or for any loss, howsoever arising, from the use of this announcement.

Notes 1) The true width of pegmatites are generally considered 80-95% of the intercept width.  
2) Only pegmatite intercepts of 1m or more in width are included.

## Appendix B

### Section 1 Sampling Techniques and Data

Criteria	JORC Code Explanation	Commentary
Sampling techniques	<p>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</p> <p>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</p> <p>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</p>	<p>Reverse Circulation Drilling, 1m samples collected</p> <p>Diamond drilling, ½ core nominally 1m crushed to 10mm. ½ of crushed sample assayed as below, ½ retained.</p> <p>Samples jaw crushed and riffle split to 2-2.5kg for pulverizing to 80% passing 75 microns.</p> <p>Prepared samples are fused with sodium peroxide and digested in dilute hydrochloric acid. The resultant solution is analysed by ICP, by Nagrom Laboratory.</p> <p>Certified standards. Field duplicates submitted at irregular intervals at the rate of approximately 1:20.</p>
Drilling techniques	<p>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</p>	<p>RC and Diamond drilling conducted in line with general industry standards.</p> <p>All diamond drill holes and approx. 70% of RC drill holes are angled. Approx. 30% of RC drill holes are vertical.</p> <p>Diamond tails have been drilled to a max depth of 330m.</p> <p>Diamond core has been oriented where possible using the Reflex Ezi-Ori tool.</p>
Drill sample recovery	<p>Method of recording and assessing core and chip sample recoveries and results assessed.</p> <p>Measures taken to maximise sample recovery and ensure representative nature of the samples.</p> <p>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</p>	<p>Chip recovery or weights for RC drilling were not conducted.</p> <p>Each metre of drill sample recovery and moisture content is visually estimated and recorded.</p> <p>Opportunity for sample bias is considered negligible for dry samples.</p>
Logging	<p>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</p> <p>Whether logging is qualitative or quantitative in nature.</p> <p>Core (or costean, channel, etc.) photography</p> <p>The total length and percentage of the relevant intersections logged.</p>	<p>Geological logs exist for all drill holes with lithological codes via an established reference legend.</p> <p>Drill holes have been geologically logged in their entirety. Where logging was detailed the subjective indications of mineral content (spodumene, tantalite) have been recorded.</p> <p>Assays have generally only been submitted through and adjacent to the pegmatites.</p>

Criteria	JORC Code Explanation	Commentary
Sub-sampling techniques and sample preparation	<p>If core, whether cut or sawn and whether quarter, half or all core taken.</p> <p>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</p> <p>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</p> <p>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</p> <p>Measures taken to ensure that the sampling is representative of the in situ material collected, including for</p> <p>instance results for field duplicate/second-half sampling.</p> <p>Whether sample sizes are appropriate to the grain size of the material being sampled.</p>	<p>RC samples were collected at 1m intervals and riffle or cone split on-site to produce a subsample less than 5kg.</p> <p>The RC drilling samples are considered robust for sampling the spodumene and tantalite mineralisation.</p> <p>Most samples were dry.</p> <p>Sampling is in line with general industry sampling practices.</p> <p>Field duplicates, standards, laboratory standards and laboratory repeats are used to monitor analyses.</p> <p>Sample size is considered appropriate.</p>
Quality of assay data and laboratory tests	<p>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</p> <p>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</p> <p>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</p>	<p>The assay technique is considered to be robust as the method used (see above) offers total dissolution of the sample and is useful for mineral matrices that may resist acid digestions.</p> <p>Standards and duplicates were submitted in varying frequency throughout the exploration campaign and internal laboratory standards, duplicates and replicates are used for verification</p>
Verification of sampling and assaying	<p>The verification of significant intersections by either independent or alternative company personnel.</p> <p>The use of twinned holes.</p> <p>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</p> <p>Discuss any adjustment to assay data.</p>	<p>Twinning of holes undertaken to date show good continuity</p> <p>The Ta and Li assays show a marked correlation with the pegmatite intersections via elevated downhole grades.</p> <p>Drill logs exist for all holes as electronic files and/or hardcopy (all 2017 logging has been input directly to field logging computers).</p> <p>Digital log sheets have been created with inbuilt validations to reduce potential for data entry errors.</p> <p>All drilling data has been loaded to a database and validated prior to use.</p>
Location of data points	<p>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</p> <p>Specification of the grid system used.</p> <p>Quality and adequacy of topographic control.</p>	<p>Accurate surveying using RTK DGPS is currently being undertaken on site. Hole collars have been preserved until completion of survey.</p> <p>All collars are surveyed using MGA Z51.</p>

Criteria	JORC Code Explanation	Commentary
Data spacing and distribution	<p>Data spacing for reporting of Exploration Results.</p> <p>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</p> <p>Whether sample compositing has been applied.</p>	<p>Initial exploration has been conducted on an 80m x 80m grid. The majority of infill drilling has been conducted on a 40m x 40m grid with a 15,000m<sup>2</sup> area drilled out to 20m x 20m.</p> <p>The spacing of holes is considered of sufficient density to provide an 'Indicated' or 'Inferred' Mineral Resource estimation and classification.</p> <p>There has been no sample compositing.</p>
Orientation of data in relation to geological structure	<p>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</p> <p>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</p>	<p>Approximately 2/3 of drilling is angled. Vertical holes have been drilled in areas where pegmatites are interpreted to be flat lying.</p> <p>The lithium tantalite-bearing pegmatites are generally flat to shallowly dipping in nature. The true width of pegmatites are generally considered 80-95% of the intercept width, with minimal opportunity for sample bias.</p>
Sample security	The measures taken to ensure sample security.	The RC samples are taken from the rig by experienced personal and stored securely and transport to the laboratory by a registered courier and handed over by signature.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	An external review of sampling techniques and data has been carried out by CSA Global. No issues identified.

## Section 2 Reporting of Exploration Results

Criteria	Explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	The portfolio of mineral tenements, comprising mining leases, exploration licences, prospecting licences, miscellaneous licences, a general-purpose lease, and a retention lease are in good standing.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	<p>Alluvial tantalite has been mined periodically from the early 1970s.</p> <p>Gwalia Consolidated Limited undertook exploration for tantalite-bearing pegmatites from 1983-1998. Work included mapping, costeaning, and several phases of drilling using RAB, RC, and diamond methods. The work identified mineral resources that were considered uneconomic at the time.</p> <p>Haddington entered agreement to develop the resource and mining</p> <ul style="list-style-type: none"> <li>commenced in 2001 and continued until 2005.</li> <li>Haddington continued with exploration until 2009.</li> </ul>

Criteria	Explanation	Commentary
		Living Waters acquired the project in 2009 and continued with limited exploration to the north of the main pit area.
Geology	Deposit type, geological setting and style of mineralisation.	<p>The Bald Hill area is underlain by generally north-striking, steeply dipping Archaean metasediments (schists and greywackes) and granitoids.</p> <p>Felsic porphyries and pegmatite sheets and veins have intruded the Archaean rocks. Generally, the pegmatites cross cut the regional foliation, occurring as gently dipping sheets and as steeply dipping veins.</p> <p>The pegmatites vary in width and are generally comprised quartz-albite- muscovite-spodumene in varying amounts. Late-stage albitisation in the central part of the main outcrop area has resulted in fine-grained, banded, sugary pegmatites with visible fine-grained, disseminated tantalite. A thin hornfels characterised by needle hornblende crystals is often observed in adjacent country rocks to the pegmatite.</p> <p>Tantalite generally occurs as fine disseminated crystals commonly associated with fine-grained albite zones, or as coarse crystals associated with cleavelandite.</p> <p>Weathering of the pegmatites yields secondary mineralised accumulations in alluvial/eluvial deposits.</p>
Drill hole Information	<p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> <li>• easting and northing of the drill hole collar</li> <li>• elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>• dip and azimuth of the hole</li> <li>• down hole length and interception depth</li> <li>• hole length.</li> </ul> <p>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</p>	<p>Only results for drill holes that have intercepted lithium and or tantalum pegmatites of 1m or more in width that have been assayed for lithium and tantalum have been included in the release.</p> <p>All drill hole details are contained in Table 1 and 2 of the release.</p>
Data aggregation methods	<p>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated.</p>	<p>No cutting to intercept grades has been undertaken.</p> <p>Assays are report as pure elements such as Li, Ta, Nb, Sn and converted to oxides using atomic formulas.</p> <p>Reported intervals in Table 1 and 2 represent the aggregation of the intercepts containing samples of at least 0.3% Li<sub>2</sub>O and/or 150ppm Ta<sub>2</sub>O<sub>5</sub>, lower grade zones are included adjacent to higher grade zones where the grade varies significantly from the average of the entire width of the mineralised pegmatite. Only lithium, tin, niobium and tantalum oxide results are</p>

Criteria	Explanation	Commentary
		tabled, other potential by-products are currently considered to be insignificant in economic importance.
Relationship between mineralisation widths and intercept lengths	<p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</p>	<p>Approximately 2/3 of drilling is angled. Vertical holes have been drilled in areas where pegmatites are interpreted to be flat lying.</p> <p>The lithium tantalite-bearing pegmatites are generally flat to shallowly dipping in nature. The true width of pegmatites are generally considered 85-95% of the intercept width, with minimal opportunity for sample bias.</p>
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Drilling locations are shown on figure 1 of the release. Appendix A comprises a long section through the principal pegmatites.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	Results for all drill holes that have intercepted lithium pegmatites that have been assayed for lithium have been included in the release.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	No metallurgical test work is referred to in this announcement.
Further work	<p>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</p> <p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>	Further RC and diamond drilling is warranted at the various deposits to explore for additional resources and improve the understanding of the current resources prior to mining.
