

Strong Lithium and Tantalum Results from Extensional Drilling at Bald Hill

18 April 2017

Tawana Resources NL (“Tawana” or the “Company”) and Alliance Mineral Assets Limited (SGX: AMAL) are pleased to announce that extensional step-out drilling at the Bald Hill project, Western Australia has intercepted the most significant lithium and tantalum results to date. These exceptional results are extensions to the initial Resource estimation which is expected to be completed by the end of April 2017 along with the Feasibility Study.

Highlights

- Significant lithium intercepts. Best results include:
 - 35m at 1.35% Li₂O from 71m, including 10m at 1.62% Li₂O, 6m at 1.61% Li₂O and 6m at 1.75% Li₂O in LRC0247;
 - 28m at 1.34% Li₂O and 343ppm Ta₂O₅ from 92m including 12m at 2.06% Li₂O and 464ppm Ta₂O₅ in LRC0226;
 - 12m at 1.16% Li₂O from 95m and 11m at 1.96% Li₂O from 131m including 5m at 3.14% Li₂O in LRC0237 (also see tantalum intercepts below)
 - 26m at 1.13% Li₂O and 309ppm Ta₂O₅ from 17m including 5m at 1.99% Li₂O in LRC0187; and
 - 12m at 1.64% Li₂O and 219ppm Ta₂O₅ from 85m in LRC0229.
- Significant tantalum pentoxide intercepts included:
 - 4m at **14,782ppm** (14.78kg/t) Ta₂O₅ and 9,974ppm Nb₂O₅ from 78m in LRC0237;
 - 8m at **2,468ppm** Ta₂O₅ from 27m including 2m 7,022ppm (7.02kg/t) Ta₂O₅ and 0.82% Li₂O in LRC0317;
 - 4m at 1,246ppm Ta₂O₅ from 47m including 1m at 4,211ppm Ta₂O₅ in LRC0318;
 - 11m at 729ppm Ta₂O₅ and 1.72% Li₂O from 134m in LRC0222; and
 - 6m at 976ppm Ta₂O₅ and 1.63% Li₂O from 154m in LRC0224.
- Resource work currently underway to facilitate starter pit design and mine scheduling. These results are outside the starter pit design and are expected to significantly increase the initial Resource.
- Increasing to five drill rigs as the extent of the spodumene pegmatites continues to expand.
- Recent drill hole (LRC0348) in the eastern extent of known mineralisation intercepted 78.6m of pegmatite including 57m of very high grade spodumene, assays are pending however visually it is the most significant hole drilled at Bald Hill to date with logged estimated spodumene contents ranging from 15 to 45% averaging about 30%.

Tawana Resources Managing Director Mark Calderwood stated: *“Recent significant drill intercepts from step-out drilling has shown the Bald Hill pegmatites are displaying unusually strong zonation, evidenced by spectacularly rich spodumene and tantalum mineralisation. This level of zonation is the preserve of the most complex pegmatite fields (such as Greenbushes and Wodgina) and has prompted the increase in the number of drill rigs. Tawana and AMAL are working towards commencement of commissioning of the spodumene plant this year, and recommencement of processing of tantalum through the existing processing facility”*

Recent Drilling²

A further 115 resource and sterilisation RC drill holes totalling 13,652m were completed between 20 February 2017 and 31 March 2017. Assays have been received for 133 holes since the 3 March, 2017 update. Recent intercepts are summarised in Tables 1 and 2 in Appendix A.

Recent high grade lithium intercepts include¹:

- 35m at 1.35% Li₂O from 71m, including 10m at 1.62% Li₂O, 6m at 1.61% Li₂O and 6m at 1.75% Li₂O in LRC0247;
- 12m at 1.16% Li₂O from 95m and 11m at 1.96% Li₂O from 131m including 5m at 3.14% Li₂O in LRC0237;
- 12m at 1.64% Li₂O and 219ppm Ta₂O₅ from 85m in LRC0229;
- 15m at 1.40% Li₂O from 116m in LRC0220;
- 12m at 1.59% Li₂O from surface comprising backfill in LRC0272;
- 17m at 1.54% Li₂O from 121m in LRC0219; and
- 15m at 1.33% Li₂O from 57m including 9m 1.89% Li₂O in LRC0244.

Notable high grade lithium and tantalum intercepts included:

- 28m at 1.34% Li₂O and 343ppm Ta₂O₅ from 92m including 12m at 2.06% Li₂O and 464ppm Ta₂O₅ in LRC0226;
- 26m at 1.13% Li₂O and 309ppm Ta₂O₅ from 17m including 5m at 1.99% Li₂O in LRC0187;
- 11m at 1.72% Li₂O and 729ppm Ta₂O₅ from 134m in LRC0222;
- 6m at 1.63% Li₂O and 976ppm Ta₂O₅ from 154m in LRC0224; and
- 15m at 1.12% Li₂O and 299ppm Ta₂O₅ from 69m in LRC0310.

Notable high grade tantalum intercepts included:

- 4m at **14,782ppm** Ta₂O₅ including 2m at **27,174ppm** (27.17kg/t) Ta₂O₅ and 9,974ppm Nb₂O₅ from 78m in LRC0237;
- 8m at **2,468ppm** Ta₂O₅ from 27m including 2m 7,022ppm (7.02kg/t) Ta₂O₅ and 0.82% Li₂O in LRC0317;
- 4m at 1,246ppm Ta₂O₅ from 47m including 1m at 4,211ppm Ta₂O₅ in LRC0318;
- 5m at 742ppm Ta₂O₅ from 87m in LRC0166;
- 7m at 662ppm Ta₂O₅ from 177m including 2m at 1,053ppm Ta₂O₅ in LRC0245; and
- 2m at 1,308ppm Ta₂O₅ from 55m in LRC0322.

Recent drill hole (LRC0348) in the eastern extent of known mineralisation intercepted 78.6m of pegmatite from 147.4m, including 57m of very high grade spodumene from 160m, assays are pending however visually it is the most significant hole drilled at Bald Hill to date with spodumene logged as the most abundant mineral with a logged range from 15-45% with an average of about 30% spodumene. Extensional drill hole LRC0405 intercepted 45m of pegmatite containing high spodumene, assays are pending.

¹ The true width of pegmatites are generally considered 80-95% of the intercept width. Only pegmatite intercepts of 1m or more in width are included. Only intercepts of 0.3% Li₂O or 150ppm Ta₂O₅ considered significant.

² These intersections are also repeated in the highlights section on the cover page.

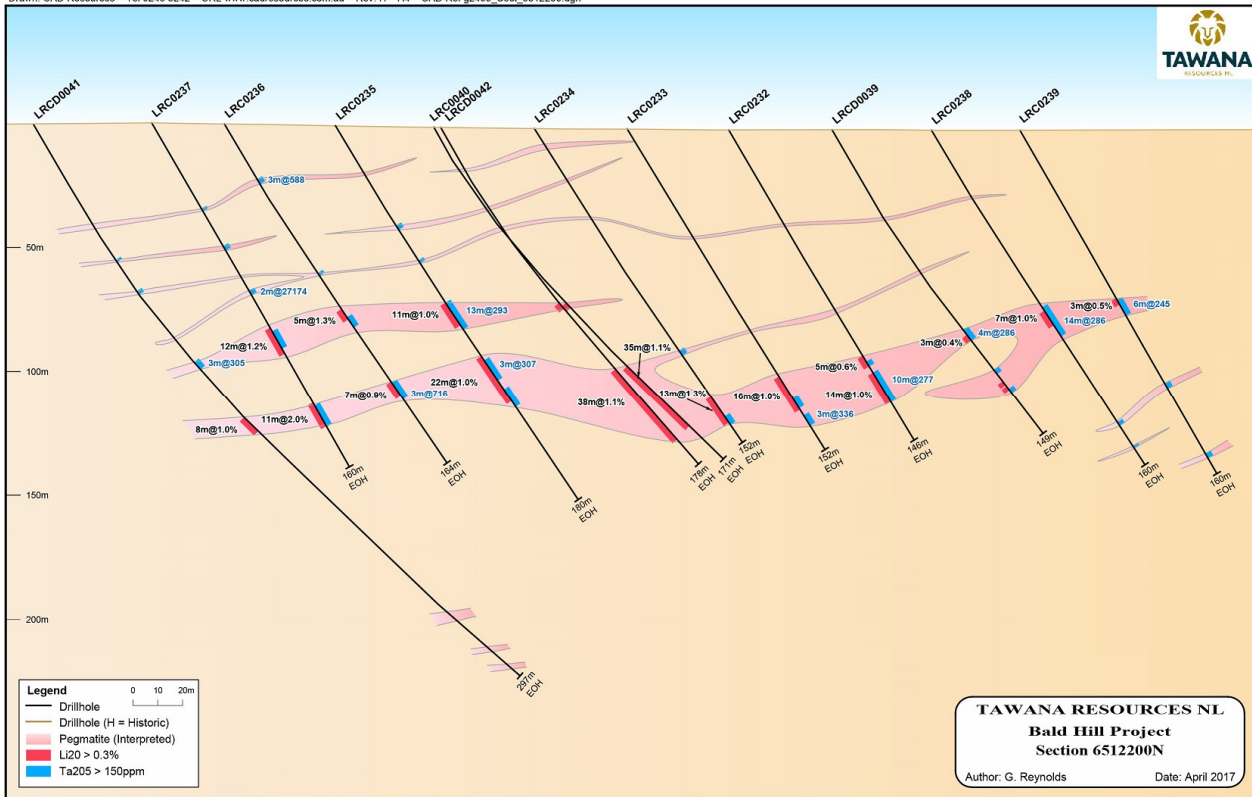

Figure 4 | Section 6512200N

Bald Hill Project (AMAL 100%, TAW Earning 50%)

The Bald Hill project (Project) area is located 50km south east of Kambalda in the Eastern Goldfields of Western Australia. It is located approximately 75km south east of the Mt Marion Lithium project and is adjacent to Tawana’s Cowan Lithium project. The Project, owned by Alliance Mineral Assets Limited (AMAL), includes a permitted tantalum (pegmatite) mine, processing facility and associated infrastructure.

Through Tawana’s 100% owned subsidiary Lithco No. 2 Pty Ltd, Tawana entered into a Farm-In Agreement on 23 February 2017 with Alliance Mineral Assets Limited (“AMAL”) with respect to AMAL’s Bald Hill project in Western Australia for the purpose of joint exploration and exploitation of lithium and other minerals.

The commercial terms require Tawana:

- i. to spend, by 31 December 2017 (or such later date as may be agreed between the parties), a minimum of \$7.5 million on exploration, evaluation and feasibility (“Expenditure Commitment”); and
- ii. to spend, \$12.5 million in capital expenditure required for upgrading and converting the plant for processing ore derived from the Project, infrastructure costs, pre-stripping activities and other expenditures including operating costs (“Capital Expenditure”) by 31 December 2019.

Upon completion of the Expenditure Commitment, Tawana shall be entitled to 50% of all rights to lithium minerals from the tenements comprising the Project ("Tenements"). AMAL and Lithco had on 10 April 2017 entered into a lithium rights joint venture agreement.

Upon completion of the Expenditure Commitment and Capital Expenditure, Tawana will be entitled to a 50% interest in the Project (being all minerals from the tenements and the processing plant and infrastructure at Bald Hill). The portfolio of mineral tenements, comprising mining leases, exploration licences, prospecting licences, miscellaneous licences, a general-purpose lease, and a retention lease are in good standing.

Feasibility Study

The Companies are in the advanced stages of completing a feasibility study with the metallurgical and process engineering aspects of the study essentially completed and the detailed mining engineering is underway. Product off-take pricing and prepayment negotiations are also in an advanced stage.

Cashflow modelling will be completed when the key areas of the study are completed. However, Tawana and AMAL have given go-ahead for the commencement of detailed design and final long lead item equipment selection.

Competent Persons Statement

The information in this news release that relates to Exploration Results is based on and fairly represents information and supporting documentation compiled by Mr Mark Calderwood and Mr Gareth Reynolds, both employees of Tawana Resources NL (“Tawana”). Mr Calderwood is a member of The Australasian Institute of Mining and Metallurgy and Mr Reynolds is a member of the Australian Institute of Geoscientists. Mr Calderwood and Mr Reynolds have sufficient experience relevant to the style of mineralisation under consideration and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves”. Mr Calderwood and Mr Reynolds consent to the inclusion in this report of the matters based on their information in the form and context in which it appears. Mr Calderwood and Mr Reynolds meet the requirements to act as a Qualified Person (as defined in the SGX Catalist rules).

Mr Calderwood is a significant shareholder in Tawana. Mr Calderwood and Tawana do not consider these to constitute a potential conflict of interest to his role as Competent Person. Mr Calderwood is not aware of any other relationship with Tawana which could constitute a potential for a conflict of interest.

Mr Reynolds is an employee of Tawana. Mr Reynolds is not aware of any other relationship with Tawana which could constitute a potential for a conflict of interest.

Forward Looking Statement

This report may contain certain forward looking statements and projections regarding estimated, resources and reserves; planned production and operating costs profiles; planned capital requirements; and planned strategies and corporate objectives. Such forward looking statements/projections are estimates for discussion purposes only and should not be relied upon as representation or warranty, express or implied, of Tawana Resources NL and/or Alliance Mineral Assets Limited. They are not guarantees of future performance and involve known and unknown risks, uncertainties and other factors many of which are beyond the control of Tawana Resources NL and/or Alliance Mineral Assets Limited. The forward looking statements/projections are inherently uncertain and may therefore differ materially from results ultimately achieved.

Tawana Resources NL and/or Alliance Mineral Assets Limited does not make any representations and provides no warranties concerning the accuracy of the projections, and disclaims any obligation to update or revise any forward looking statements/projects based on new information, future events or otherwise except to the extent required by applicable laws. While the information contained in this report has been prepared in good faith, neither Tawana Resources NL and/or Alliance Mineral Assets Limited or any of their directors, officers, agents, employees or advisors give any representation or warranty, express or implied, as to the fairness, accuracy, completeness or correctness of the information, opinions and conclusions contained in this presentation. Accordingly, to the maximum extent permitted by law, none of Tawana Resources NL and/or Alliance Mineral Assets Limited, their directors, employees or agents, advisers, nor any other person accepts any liability whether direct or indirect, express or limited, contractual, tortious, statutory or otherwise, in respect of, the accuracy or completeness of the information or for any of the opinions contained in this announcement or for any errors, omissions or misstatements or for any loss, howsoever arising, from the use of this announcement.

Notes 1) The true width of pegmatites are generally considered 80-95% of the intercept width.
2) Only pegmatite intercepts of 1m or more in width are included.

Notes

- 1) Only intercepts of 0.3% Li₂O or 150ppm Ta₂O₅ considered significant.
- 2) No significant intercepts in holes LRC0156, LRC0279 and LRC0307
- 3) LRC0199 and LRC0200 returned significant intercepts from tailings
- 4) LRC0272 returned significant intercept from backfilled material
- 5) LRC0235 86-87m assays pending

Appendix B

Section 1 Sampling Techniques and Data

Criteria	JORC Code Explanation	Commentary
Sampling techniques	<p>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</p> <p>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</p> <p>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</p>	<p>Reverse Circulation Drilling, 1m samples collected</p> <p>Diamond drilling, ½ core nominally 2m crushed to 10mm</p> <p>Samples jaw crushed and riffle split to 2-2.5kg for pulverizing to 80% passing 75 microns.</p> <p>Prepared samples are fused with sodium peroxide and digested in dilute hydrochloric acid. The resultant solution is analysed by ICP, by Nagrom Laboratory.</p> <p>Certified standards. Field duplicates submitted at irregular intervals at the rate of approximately 1:25.</p>
Drilling techniques	<p>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</p>	<p>RC and Diamond drilling conducted in line with general industry standards.</p> <p>All diamond drill holes and approx. 98% of RC drill holes are angled. Approx. 2% of RC drill holes are vertical</p> <p>Diamond core has been oriented where possible</p>
Drill sample recovery	<p>Method of recording and assessing core and chip sample recoveries and results assessed.</p> <p>Measures taken to maximise sample recovery and ensure representative nature of the samples.</p> <p>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</p>	<p>Chip recovery or weights for RC drilling were not conducted.</p> <p>Each metre of drill sample recovery and moisture content is visually estimated and recorded.</p> <p>Opportunity for sample bias is considered negligible for dry samples.</p>
Logging	<p>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</p> <p>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography</p> <p>The total length and percentage of the relevant intersections logged.</p>	<p>Geological logs exist for all drill holes with lithological codes via an established reference legend.</p> <p>Drill holes have been geologically logged in their entirety. Where logging was detailed the subjective indications of spodumene content</p> <p>Assays have generally only been submitted through and adjacent to the pegmatites.</p>

Criteria	JORC Code Explanation	Commentary
Sub-sampling techniques and sample preparation	<p>If core, whether cut or sawn and whether quarter, half or all core taken.</p> <p>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</p> <p>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</p> <p>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</p> <p>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</p> <p>Whether sample sizes are appropriate to the grain size of the material being sampled.</p>	<p>RC samples were collected at 1m intervals and riffle or cone split on-site to produce a subsample less than 5kg.</p> <p>The RC drilling samples are considered robust for sampling the spodumene and tantalite mineralisation.</p> <p>Most samples were dry.</p> <p>Sampling is in line with general industry sampling practices.</p> <p>Field duplicates, laboratory standards and laboratory repeats are used to monitor analyses.</p> <p>Sample size is considered appropriate.</p>
Quality of assay data and laboratory tests	<p>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</p> <p>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</p> <p>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</p>	<p>The assay technique is considered to be robust as the method used (see above) offers total dissolution of the sample and is useful for mineral matrices that may resist acid digestions.</p> <p>Standards and duplicates were submitted in varying frequency throughout the exploration campaign and internal laboratory standards, duplicates and replicates are used for verification</p>
Verification of sampling and assaying	<p>The verification of significant intersections by either independent or alternative company personnel.</p> <p>The use of twinned holes.</p> <p>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</p> <p>Discuss any adjustment to assay data.</p>	<p>Twinning of holes undertaken to date show good continuity</p> <p>The Ta and Li assays show a marked correlation with the pegmatite intersections via elevated downhole grades.</p> <p>Drill logs exist for all holes as electronic files and/or hardcopy (all 2017 logging has been input directly to field logging computers).</p> <p>Digital log sheets have been created with inbuilt validations to reduce potential for data entry errors.</p> <p>All drilling data has been loaded to a database and validated prior to use.</p>
Location of data points	<p>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</p> <p>Specification of the grid system used.</p> <p>Quality and adequacy of topographic control.</p>	<p>Collar coordinates are currently only approximate and considered accurate to within 4m measured using hand held GPS. Accurate surveying using RTK DGPS is currently being undertaken on site. Hole collars have been preserved until completion of survey.</p>

Criteria	JORC Code Explanation	Commentary
Data spacing and distribution	Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied.	Drilling has been conducted on a 40m x 40m grid, with a 140m x 80m area drilled out at 20m x 20m. The spacing of holes is considered of sufficient density to provide an 'Indicated' or 'Inferred' Mineral Resource estimation and classification. There has been no sample compositing.
Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	The majority of drilling is angled. Some vertical holes have been drilled in areas where access is limited. The lithium tantalite-bearing pegmatites are generally flat to shallowly dipping in nature. The true width of pegmatites are generally considered 80-95% of the intercept width, with minimal opportunity for sample bias.
Sample security	The measures taken to ensure sample security.	The RC samples are taken from the rig by experienced personal and stored securely and transport to the laboratory by a registered courier and handed over by signature.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	No audits have been undertaken to date.

Section 2 Reporting of Exploration Results

Criteria	Explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	The portfolio of mineral tenements, comprising mining leases, exploration licences, prospecting licences, miscellaneous licences, a general-purpose lease, and a retention lease are in good standing.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	Alluvial tantalite has been mined periodically from the early 1970s. Gwalia Consolidated Limited undertook exploration for tantalite-bearing pegmatites from 1983-1998. Work included mapping, costeaning, and several phases of drilling using RAB, RC, and diamond methods. The work identified mineral resources that were considered uneconomic at the time. Haddington entered agreement to develop the resource and mining <ul style="list-style-type: none"> • commenced in 2001 and continued until 2005. • Haddington continued with exploration until 2009. Living Waters acquired the project in 2009 and continued with limited exploration to the north of the main pit area.

Criteria	Explanation	Commentary
Geology	Deposit type, geological setting and style of mineralisation.	<p>The Bald Hill area is underlain by generally north-striking, steeply dipping Archaean metasediments (schists and greywackes) and granitoids.</p> <p>Felsic porphyries and pegmatite sheets and veins have intruded the Archaean rocks. Generally, the pegmatites cross cut the regional foliation, occurring as gently dipping sheets and as steeply dipping veins.</p> <p>The pegmatites vary in width and are generally comprised quartz-albite- muscovite-spodumene in varying amounts. Late-stage albitisation in the central part of the main outcrop area has resulted in fine- grained, banded, sugary pegmatites with visible fine-grained, disseminated tantalite. A thin hornfels characterised by needle hornblende crystals is often observed in adjacent country rocks to the pegmatite.</p> <p>Intrusives. Tantalite generally occurs as fine disseminated crystals commonly associated with fine-grained albite zones, or as coarse crystals associated with cleavelandite.</p> <p>Weathering of the pegmatites yields secondary mineralised accumulations in alluvial/eluvial deposits.</p>
Drill hole Information	<p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> • easting and northing of the drill hole collar • elevation or RL (Reduced Level - elevation above sea level in metres) of the drill hole collar • dip and azimuth of the hole • down hole length and interception depth • hole length. <p>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</p>	<p>Only results for drill holes that have intercepted lithium and or tantalum pegmatites of 1m or more in width that have been assayed for lithium have been included in the release.</p> <p>All drill hole details are contained in Table 2 and 3 of the release.</p>
Data aggregation methods	<p>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</p> <p>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</p> <p>The assumptions used for any reporting of metal equivalent values</p>	<p>No cutting to intercept grades has been undertaken.</p> <p>Assays are report as pure elements such as Li, Ta, Nb, Sn and converted to oxides using atomic formulas.</p> <p>Reported intervals in Table 1 and 3 represent the aggregation of the intercepts containing samples of at least 0.3% Li₂O and/or 150ppm Ta₂O₅, lower grade zones are included adjacent to higher grade zones where the grade varies significantly from the average of the entire width of the mineralised pegmatite. Only lithium, tin, niobium and tantalum oxide results are tabled, other potential by-products are currently considered to be insignificant in economic importance.</p>

Criteria	Explanation	Commentary
	should be clearly stated.	
Relationship between mineralisation widths and intercept lengths	<p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</p>	<p>The majority of drilling is angled. Some vertical holes have been drilled in areas where access is limited.</p> <p>The lithium tantalite-bearing pegmatites are generally flat to shallowly dipping in nature. The true width of pegmatites are generally considered 85-95% of the intercept width, with minimal opportunity for sample bias.</p>
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Drilling locations are shown on figure 1 of the release.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	Results for all drill holes that have intercepted lithium pegmatites that have been assayed for lithium have been included in the release.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	No metallurgical test work is referred to in this announcement.
Further work	<p>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</p> <p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>	Further RC and diamond drilling is warranted at the various deposits to explore for additional resources and improve the understanding of the current resources prior to mining.
