November 8th 2016 **ASX Release**

Drilling extends Earl Grey pegmatite another 500m to ~1.9km

Plus, assays from Resource drilling continue to show high grades over substantial widths; maiden Resource in early December

Highlights

- **Drilling at the Earl Grey lithium deposit within the Mt Holland Project in WA has extended the known pegmatite by another 500m to ~1.9km; known width is up to 750m with an estimated true thickness of 70-80m.**
- **The latest extension is down-dip to the north; the pegmatite remains open to the north, east and west.**
- **Current Earl Grey Drilling is targeting Lithium mineralisation that sits directly below the historic gold JORC 2012 Resource (see ASX Announcement 18th December 2015).**
- **Resource drilling at Earl Grey returns more wide, high-grade intersections which demonstrate continuity of the mineralisation. Latest results include:**
  - **53m @ 1.62% Li_2O from 243m incl. 8m @ 2.17% Li_2O from 244m & 14m @ 2.21% Li_2O from 254m; and 4m @ 2.1% Li_2O from 218m in KEGR081**
  - **37m @ 1.71% Li_2O from 65m incl. 14m @ 1.98% Li_2O from 67m, & 36m @ 1.74% Li_2O from 114m incl. 9m @ 1.97% Li_2O from 115m, & 8m @ 1.97% Li_2O from 135m in KEGR080**
  - **44m @ 1.31% Li_2O from 55m in KEGR046**
  - **54m @1.36% Li_2O from 93m in KEGR047**
  - **14m @ 1.96% Li_2O from 205m & 61m @ 1.54% Li_2O from 227m incl. 10m @ 1.98% Li_2O from 243m in KEGR063**
  - **42m @ 1.35% Li_2O from 43m in KEGR058**
  - **52m @ 1.21% Li_2O from 65m & 10m @ 1.63% Li_2O from 127m in KEGR069**
  - **19m @ 1.34% Li_2O from 106m & 38m @ 1.5% Li_2O from 129m in KEGR070**

Kidman Resources Limited (ASX: KDR) ("Kidman or the "Company") is pleased to advise that step out drilling has extended the known length of its Earl Grey lithium pegmatite by another 500m, taking it to ~1.9km.

Earl Grey, which is within the Mt Holland Project near Southern Cross in WA, has now been outlined over an area measuring ~1.9km by up to 750m and remains open in multiple directions. It also sits on an existing Mining Lease.

The latest extension to the known mineralisation results from drilling down-dip to the north, where the pegmatite remains open. Assays are awaited on this latest extension. This drilling is targeting the pegmatite that sits directly below the Twining's Gold Resource which is 2012 JORC Compliant (see ASX Announcement 18th December 2015). Kidman will begin to explore several scenarios that may positively impact on the Northern extents of the Earl Grey pegmatite.

Kidman also advises that the latest assays from the resource drilling program at Earl Grey continue to demonstrate the continuity of the wide, high-grade lithium mineralisation.

The resource drilling, which was completed about a fortnight ago, was conducted over the initial 1.4km by 750m area. The maiden Resource estimate is on track for release early next month.

Metallurgical test work is continuing on the Earl Grey Pegmatite with preliminary findings expected within the next few weeks.

Kidman has also commenced drilling at the Prince of Wales pegmatite, located on the same geological structure as Earl Grey approximately 2.5km North of Earl Grey.

RAB drilling by explorers in the 1970s and 1980s delineated pegmatite near the surface but no lithium assaying was undertaken. Drilling is now testing these occurrences, with the merits of further drilling to be determined once lithium mineralisation is confirmed. Earl Grey and Prince of Wales are just two of several extensive pegmatites outlined at Mt Holland.

Kidman Background

Kidman is a diversified resource company which owns the Mt Holland lithium and gold project near Southern Cross in WA (see ASX Announcement 18th December for further details of the project). The Company intends to revise the existing gold resource at Mt Holland with a significant RC and Diamond drilling program, followed by an update to the feasibility study undertaken by previous operators. The company is now also drilling to further test the highly prospective Lithium targets within the Mt Holland tenement package and has entered into an MOU to potentially process Lithium ores at the Lake Johnston 1.5Mtpa concentrator owned by Poseidon Nickel.

Kidman also owns the Burbanks Gold Mine near Coolgardie in WA.

Kidman also owns advanced exploration projects in the Northern Territory (Home of Bullion – Cu, Au, Pb, Zn, Ag/ Prospect D - Ni, Cu) and New South Wales.

In New South Wales the company has the Crowl Creek Project which is host to numerous projects such as Murrays (Au) Blind Calf (Cu, Au) and Three Peaks (Cu, Pb, Ag).

The Company also owns the Brown's Reef project in the southern part of the Cobar Basin (Zn, Pb, Ag, and Cu).

For further information on the Company's portfolio of projects please refer to the website at: www.kidmanresources.com.au

Competent Persons Statement

Exploration:

The information in this release that relates to sampling techniques and data, exploration results, geological interpretation and exploration targets has been reviewed by Mr L Sawyer M.App.Sc. Mr Sawyer is not an employee of the company, but is employed by Geos Mining as a contract consultant. Mr Sawyer is a member of the Australian Institute of Geoscientists, he has sufficient experience with the style of mineralisation and type of deposit under consideration, and to the activities undertaken, to qualify as a competent person as defined in the 2012 edition of the "Australian Code for the Reporting of Exploration Results, Mineral Resources and Ore Reserves" (The JORC Code). Mr Sawyer consents to the inclusion in this report of the contained technical information in the form and context as it appears.

The information in this release that relates to sampling techniques and data, Exploration Results, geological interpretation and Exploration Targets has been compiled by Mr. Michael Green BSc (Hons), MAusIMM, an employee of the Company. Mr. Green is a Member of the Australian Institute of Mining and Metallurgy and he has sufficient experience with the style of mineralisation and types of deposits under consideration, and to the activities undertaken, to qualify as a competent person as defined in the 2012 Edition of the "Australian Code for the Reporting of Exploration Results, Mineral Resources and Ore Reserves (The JORC Code). Mr. Green is a shareholder in KDR. Mr. Green consents to the inclusion in this report of the contained technical information in the form and context in which it appears.

Cautionary Statement:

Readers should use caution when reviewing the exploration and historical information results presented and ensure that the Modifying Factors described in the 2012 edition of the JORC Code are considered before making an investment decision. Potential quantity and grade is conceptual in nature, that there has been insufficient exploration to define a Mineral Resource, and that it is uncertain if further exploration will result in the determination of a Mineral Resource.

Information in this report may also reflect past exploration results, and Kidman's assessment of exploration completed by past explorers, which has not been updated to comply with the JORC 2012 Code. The company confirms it is not aware of any new information or data which materially affects the information included in this announcement

Appendix 4

JORC Code, 2012, Table 1

SECTION 1 SAMPLING TECHNIQUES AND DATA

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• This table relates to recent sampling of target identified reverse circulation (RC) spoil samples of spodumene bearing pegmatite from a recent surface drill holes KEGR034, KEGR046, KEGR047, KEGR052, KEGR058, KEGR063, KEGR066, KEGR37, KEGR038, KEGR039, KEGR040, KEGR041, KEGR067,KEGR068, KEGR069, KEGR070, KEGR075, KEGR080, and KEGR081 as detailed in Appendix 1 – Table1.; at Earl Grey Deposit (refer Figures 1 to 5 in text) undertaken by KDR at the Mt Holland project. Earl Grey is 3km north-northwest of Bounty Gold Mine. • All drill holes (Appendix 1) had sample intervals selected from them by KDR in this programme; selected on average at 1m, based on return interval and geological logging. • Selected core sample intervals from cored holes (refer to Appendix 1) were taken from the core trays by lengthwise half core cutting method as per industry standard practice. • Selected spoil sample intervals form reverse circulation drill holes (refer to Appendix 1) including the top RC drilled portion of diamond core holes (refer to Appendix 1) were taken from the spoil bags by cone and quarter method as per industry standard practice for the other drill holes. • Samples were selected on a basis of pegmatite intersection and notable spodumene occurrence, hence are not an unbiased sample. • Samples were forwarded to certified laboratory for analysis where they were weighed, crushed, reweighed, pulverised and split to produce a ~200g pulp subsample to use in the assay process. • 2843 samples were assayed by inductively coupled plasma mass spectrometry (ICP) or mass spectrometry (MS) and indicated in the heading of Table 2 Appendix 2. • 87 duplicate samples were in evidence for the reported sampled intervals. • 91 check standard samples were in evidence for the reported sampled intervals.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Reverse circulation drilled holes (refer to Appendix 1 or *Sampling Techniques* above) were drilled by reverse circulation (RC) technique at a standard RC drilling diameter (92mm – 132mm).
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• All drill holes were geologically logged and recorded within a database by KDR. • Selected sample intervals from the reported drill holes have been logged and compiled into a database. • Recoveries for RC pre-collar and RC drill holes are not apparent, however are expected to be 70-90% in this geological / geomorphological setting. • Recoveries for the drill core are in the order of 95-100%.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Both quantitative and qualitative geological information captured by KDR personnel is imported and consolidated into a database, for interpretation, analysis, and verification purposes. • All drill hole data includes: ○ Geological logging over geological and alteration basis, dependent on observed changes for various parameters (e.g. lithology, mineralogy, weathering, structural occurrence, etc.) • The geological logging is compiled with appropriate attention to detail. • High level of standard practice is apparent in the detail of the logging by KDR. • The database is hence used for interpretation and geological modelling purposes.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.*	• Select sample intervals were sub-sampled on a near to 1 meter basis within geological boundaries. Interval samples of less than 1m are restricted by geological, alteration or other notable feature boundary. • Core samples were marked up prior to logging and sampling as per standard industry practice. • The core samples selected were cut lengthwise by diamond blade saw to give two half core lengths, this is normal industry practice.

For personal use only

For personal use only

	• *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• One half of the selected core sample was collected and bagged, marked up and forwarded to a laboratory for analysis. The remainder of the sample length split samples have been retained. • Spoil bags selected from RC holes for sampling were cone and quarter split, with ¼ of the spilt being bagged as the sample for analysis. It is standard industry practice to either retain a ¼ split for future studies and or to retain a chip tray of the spoils for future viewing. • A total of 1655 samples were collected from a total drilled length of 2762m. • The NATA accredited laboratory is registered to ISO 9001:2008 chemical analyses standards. They use industry best practice in the sample preparation facility and within the laboratory. • The sample preparation procedure used includes the following: o Sort all samples and note any discrepancies to the submittal form o Record a received weight (WEI-21) for each sample, o Crush samples to 6mm nominal (CRU-21), o Record a crushed samples weight, o Split any samples >3.2Kg using a riffle splitter (SPL-21), o Generate internal laboratory duplicates for nominated samples, assigning a 'D' suffix to the sample number, o Pulverise samples in LM5 pulveriser until grind size passes 90% passing 75μm (PUL-23), o Check pulverise size on 1:20 wet screen (PUL-QC), o Take ~ 100g work master pulp for 0.2g sample for sodium pentoxide fusion with ICP-OES or ICP_MS finish. • The elements the samples were assayed for in the laboratory are: Al_2O_3, As, CaO, Co, Cr_2O_3, Cu, Fe_2O_3, K_2O, Li_2O, MgO, MnO, Ni, Pb, S, SiO_2, TiO_2, Zn, Cs, Nb, Rb, Sn, Ta, Th, and U. • The code for the used laboratory method, the method units of measure, limits of detection are shown in Table 2, Appendix 2. • A small number of select samples had gold (Au) analyses conducted on them (refer to Appendix 2). • Seven grab samples were also collected from the Bounty Mine waste dump and forwarded for analyses as above (refer to Appendix 2).
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• For the all samples being reported elemental concentrations has been determined as per the outline in the proceeding item. These are listed in Appendix 2. • No geophysical results are reported. • Limited field QAQC has been supplied by KDR for the reported intervals. • 1655 samples were assayed by inductively coupled plasma mass spectrometry (ICP) or mass spectrometry (MS) and indicated in the heading of Table 2 Appendix 2. • In addition 59 duplicate samples were submitted for the reported sampled intervals. This is 4% of the total number of samples, representing a ratio of approximately 1 duplicate sample in every 28 samples. • A further 53 check / standard samples were submitted for the reported sampled intervals. This is 3% of the total number of samples, representing a ratio of approximately 1 check/standard sample in every 31 samples. • QAQC is also reliant upon high standard laboratory practice and supply of laboratory internal QAQC data.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• As far as the technical expert is aware no historical drill holes have been specifically twinned by KDR. • Industry standard practice is assumed for activities which occurred prior to KDR. • Primary historical data and any re-logging / new sampling data have been compiled into the database. This database is in a process of on-going re-evaluation and consolidation by KDR. This standard practice and is expected to continue to/be develop/developed as the project progresses. • No adjustments or calibrations to the original assay data have been made, all original data is maintained within the database. • All reported intercept intervals are normalised to the sample interval – weighted average method.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• All co-ordinates are MGA94 zone 50S grid datum. • Vertical regional level (RL) is assumed to be Australian height datum level as the drill hole has an RL of whilst a local topographic peak at Mount Holland is 473 m above sea level. • The drill holes were surveyed by hand held GPS. • Re-survey of the drill hole collar co-ordinates has recently been undertaken by KDR. The co-ordinates given in

For personal use only

		Appendix 1 are understood by the technical expert to be re-survey co-ordinates.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• The reported results are based on selective sampling of target identified core and spoil samples (spodumene bearing pegmatite) from the most recent drill holes being reported (refer to Appendix 1) at Earl Grey Gold Deposit. • Samples were selected on a basis of pegmatite occurrence and high visual spodumene occurrence, hence are not an unbiased sample. Though this is common practice for such type of deposit. • The recent spacing of the drill holes being reported (refer to figure 1-4, Appendix 1 and Appendix 2) alone are not sufficient to establish a high degree of geological and grade continuity appropriate for Mineral Resource and Ore Reserve reporting. • Combined with all previous drilling results at Earl Grey Deposit to date; a higher degree of geological control, continuity and confidence may be gained to enable maiden resource modelling and definition to be undertaken in the near future. • The reported intervals (within text and Appendix 3) are weighted average grades over the summed thicknesses, this is normal industry practice. • Historical and previous KDR drill hole data and surface mapping indicates a high number of pegmatite intersections in the Mt Holland Project leases (refer to ASX Announcement 21 September 2016) and occurrences in application E77/2244 to the north. It is not known if all these intersections are spodumene bearing.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• The orientation and other locality details of the drill holes concerned in this announcement are given in Appendix 1, Table 1 in the text. • The orientation of the drill holes in relation to the pegmatites sampled as interpreted by KDR are shown on the sections Figures 3 and Figure 4; initial geological modelling indicates the drill holes intersected the pegmatite at relatively acute angles (less than 90^{o}), and therefore the intersect length is not considered a representations of the pegmatite true thickness. • True thickness is estimated from the drill holes angle of repose and the intersected pegmatite interval; this continues to gives an estimated true thickness of 40-80m, dependent upon the drill hole in review. • Discussions with KDR personnel indicated that in the main the pegmatite has a gentle westerly dip (Figure 3 and 4 in text) in the drilled section but steepens with depth. However elsewhere in the Mount Holland Project there are other pegmatite occurrences which appear to be southeast dipping and others which are near vertical. The pegmatites can be truncated by east – northeast trending fracture zones. • Relationship of the pegmatites and local or regional structures has not been fully established at this stage. • Pegmatites may intrude along fracture zones. • Several occurrences of shallow angle outward trending narrow extensions (apophysis) from the main pegmatite have been noted in previous drilling. These are variably mineralised with spodumene. These may affect mine planning and resource modelling.
Sample security	• *The measures taken to ensure sample security.*	• Sample chain of custody is managed by KDR. • Samples were collected and stored on site prior to delivery to the laboratory in Perth by KDR personnel. • Whilst in storage samples are kept in a locked yard. • Tracking sheets are used to track the progress of batches of samples.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• Internal review of sampling techniques as well as data handling and validation is conducted by KDR as part of due diligence and continual review of protocols. • Further application of industry best practice in applying statistically valid number of field duplicates and field standards within intervals of high interest is being addressed as part of the ongoing sampling programme. • Recording of LOI from sample analyses is also recommended to be included in all sample results.

For personal use only

SECTION 2 REPORTING OF EXPLORATION RESULTS

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• KDR has acquired the Mt Holland package of tenements. • A forfeiture claim is pending a portion of the tenement package however the tenure of KDR has shown the tenements to be in good standing. • Application E77/2244 is pending grant. • No cultural heritage issues have been reported.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Potential first recognised in 1980 by Harmark – Au and Ni • In 1985 Aztec conducted soil sampling of the tenement which highlighted a number of discrete zones with values ranging from 100ppb-1000ppb Au within a broad anomalous trend and significant anomalism around the future Bounty pit. The anomalies were then tested with RAB drilling. • During 1986 further RAB and follow-up RC intersected the main body of gold (Au) mineralisation which was eventually drilled out on 20x12m. The Au mineralisation was recognised as being associated with the pyrite and pyrrhotite. • Transient Electromagnetic surveys (TEM) were conducted over and along strike of the Bounty ore body further delineating the resource. This found that the data was dominated by a westerly dipping, near vertical semi-continuous conductive zone, which thickens to the south and extends over the length of the survey. This is associated with sulphides within and peripheral to the contacts of the Bounty horizon. • In 1989 mining of the Bounty pit started. • The total ore mined from the Bounty, West and North Bounty pits was 640,000t @ 5.55g/t Au or 114,000oz Au. • Minor RAB and occasional RC drilling was undertaken north and south testing for strike extension. This effectively closed off the Au resource to the north but left it open to the south. • In 1997 Forrestania drilled a number of holes to the east of the pit to test for potential nickel mineralisation. • No known previous exploration focussed on lithium.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• Regional Geology • N-S trending linear greenstone stratigraphy • E-W cross-cutting Proterozoic dykes • Alternating peridotitic and basaltic komatiites to the east, overlain by sheared and brecciated metasediment, which in turn has a sheared upper contact with the overlying dolerite. • Intrude by granite to the east and west. • Local Bounty Mine Geology • Bounty Horizon BIF (a variably deformed Fe-Am-chert formation) is the western most and youngest horizon of an ultramafic sequence of basaltic and peridotitic komatiite and associated sediments known as the Bounty sequence; strike N-S. • Hanging wall dolerite has a mylonitised chloritic sheared contact. • Sequence is a near-vertical, westerly dipping (75^{o}–85^{o}) semi-continuous horizon with discontinuities due to cross cutting fracture zones. • Fracture zones are intruded by pegmatites and younger north-northeast trending dykes i.e. the 280m wide Proterozoic Binneringie dyke. • Spodumene (lithium containing mineral) bearing pegmatite zonation within larger pegmatite body; typical LIT pegmatite association. • Zonation of pegmatites within the Mt Holland project is not fully understood or has not been fully investigated at this stage. • The current drill holes and the assay results indicate that the pegmatite is zoned. Ongoing work will assist to better understand this zonation.

For personal use only

Drillhole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* • *easting and northing of the drill hole collar* • *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* • *dip and azimuth of the hole* • *down hole length and interception depth* • *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Details of the drill holes being reported are listed in Table 1 – Appendix 1. • The interception depth of the pegmatite intervals is given in Appendix 2. • All horizontal co-ordinates are MGA94 zone 50S grid datum. • Vertical regional level (RL) is assumed to be Australian height datum level as the surface drill holes have an RL of 447m to 450m whilst a local topographic peak at Mount Holland is 473 m above sea level. • Re-survey of the drill hole collar co-ordinates has recently been undertaken by KDR. The co-ordinates given in Appendix 1 are understood by the technical expert to be re-survey co-ordinates.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated*	• Sample intervals selected (Table 2 – Appendix 2) are based on 1m lengths within geological feature boundaries. A number of sample intervals maybe less than 1m (particularly in DDH drill hole KEGR004) due to various geological boundaries. • RC drill holes are logged and generally sampled on a 1m return of drill spoils basis. • For assay results greater than (>) 1% Li2O a weighted average result has been reported: • The assay results are weighted averaged to the individual sample lengths over the combined interval. • No metal equivalent has been used. • No top cut has been applied.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known')..*	• The relationship between sample interval lengths to the pegmatite orientation and drill core orientation has not been fully noted. However the inclination of the drill to the opposing dipping trend of the pegmatite implies that the drill sample length of 1 m is less than 1m vertical distance. • Sample intervals are restricted by geological contacts and changes where applicable. • Initial modelling indicates the drill holes intersect pegmatite at acute angles. • Interpretation shown in Figure1-5 indicates drill holes intersect the pegmatite at acute angles and do not reflect true thickness over the pegmatite in the logged intersects. • Pegmatite true thickness intersection is estimated at s 40 – 80 m in length from the reported drill holes. • Work to define the continued trend and variability of the pegmatite is ongoing.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Diagrams of the location of the drill holes have been provided as Figures 1,. • The current preliminary results alone are sufficient in numbers only to enable a preliminary geological interpretation of the pegmatite section drilled by these holes to be made. • The combined results from all the 2016 work by KDR enable for a more detailed geological interpretation. • Ongoing planned work will progress the geological knowledge and model enabling further detailed interpretation plans and sections to be constructed.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• The current results reported constitute all known results for lithium mineralisation within pegmatite intersected by drill holes reported in Appendix 1 – Table 1 at Earl Grey Deposit. • All sample assay results to date for the pegmatite intersection in drill holes listed in Appendix 1 – Table 1 are reported in Appendix 2, Table 2. • Appendix 3 – Table 3, is a summary of the announced weighted average lithium mineralisation intersections from the drilling (refer Appendix 1) in this announcement, at Earl Grey Deposit.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances..*	• Systematic sampling and multi element assaying of the pegmatites has not historically been conducted and has only been commenced by KDR within the past year. • This work is part of continued and ongoing work aimed at improving the geological knowledge of the mineralised pegmatite at Earl Grey Deposit. • This work confirms earlier re-assay results for selected reverse circulation drill holes which were drilled into the pegmatite at Earl Grey (ASX Announcement 15th July 2015) and are additional

		to the KDR drill programme results reported in ASX Announcement 2 September 2016, ASX Announcement 21 September 2016, ASX Announcement 03 October 2016, ASX Announcement 10 October 2016 and ASX Announcement 28 October 2016.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Any further sampling of spodumene pegmatite intersection from drill holes from within the Mount Holland Project (including Earl Grey Deposit) undertaken by KDR will be reported in accordance with reporting standards. • Results of analyses of samples outstanding, pending or future will be reported in accordance to the 2012 JORC Code. • Current ongoing work is successfully building a model of the geology, mineralogy and geochemistry of these pegmatites. • Further planned work is intended to assist in defining the mineralisation within the pegmatites; with the intent to produce a maiden resource. • NO bulk density samples have been reported to the technical expert. • Provision must be made to conduct some core bulk density testing of mineralised and non-mineralised pegmatite material in the very near future. Bulk density determination will be necessary for any resource modelling work. This is currently underway with all Diamond drilling to be tested every 5 metres across all geological units. • Continued project-wide geological review and database consolidation is expected to assist in locating further historically mapped pegmatites and or other pegmatites not previously identified.

For personal use only
